

## **In the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims**

1. (Currently Amended) A backlight module applied in a liquid crystal display with a first panel and a second panel, wherein the second panel is disposed opposite to the first panel and the backlight module is disposed between the first panel and the second panel, comprising:

a first light source and a second light source; and

a lamp-holding member, disposed between the first light source and the second light source, wherein the lamp-holding member comprises;

a first side clipping part; and a second side clipping part, for holding the first light source and the second light source respectively so that the first light source and the second light source are spaced with a distance; and

a vertical supporting part which is positioned between the first side clipping part and the second side clipping part and extends upward and downward for spacing the first panel and the second panel; ~~the first side clipping part and the second side clipping part hold the first light source and the second light source respectively so that the first light source and the second light source are spaced with an equal distance.~~

2. (Currently Amended) ~~The backlight module according to claim 1, wherein the backlight module further comprises~~ A backlight module applied in a liquid crystal display with a first panel and a second panel, wherein the second panel is disposed opposite to the first panel and the backlight module is disposed between the first panel and the second panel, comprising:

a first light source and a second light source;

a lamp-holding member, disposed between the first light source and the second light source, wherein the lamp-holding member comprises a first side clipping part, a second side clipping part and a vertical supporting part which is positioned between the first side clipping part and the second side clipping part; the first side clipping part and the second side clipping part hold the first light source and the second light source respectively so that the first light source and the second light source are spaced with a distance; and

a first optical device and a second optical device, and the vertical supporting part of the lamp-holding member comprises a first cone and a substantially symmetric second cone, the first cone is a solid body which narrows to a first point from a first round base of the first cone, the second cone [[,]] is a solid body which narrows to a second point from a second round base of the second cone, the first point of the first cone is in touch with the first optical device, and the second point of the second cone is in touch with the second optical device so that the first optical device and the second optical device are spaced with a second ~~equal~~ distance.

3. (Original) The backlight module according to claim 2, wherein the first cone and the second cone have a reflecting surface, separately.

4. (Original) The backlight module according to claim 1, wherein the material of the lamp-holding member is plastic (PC).

5. (Original) The backlight module according to claim 1, wherein the material of the lamp-holding member is polymethylmethacrylic (PMMA).

6. (Currently Amended) A liquid crystal display, comprising:

a first panel and a second panel, wherein the second panel is disposed opposite to the first panel; and

a backlight module disposed between the first panel and the second panel, wherein the backlight module comprises:

a first light source and a second light source;

a lamp-holding member, disposed between the first light source and the second light source, wherein the lamp-holding member comprises:

a first side clipping part; and a second side clipping part, for holding the first light source and the second light source respectively so that the first light source and the second light source are spaced with a distance; and

a vertical supporting part which is positioned between the first side clipping part and the second side clipping part and extends upward and downward for spacing the first panel and the second panel; ~~the first side clipping part and the second side clipping part hold the first light source and the second light source respectively so that the first light source and the second light source are spaced with an equal distance.~~

7. (Currently Amended) ~~The liquid crystal display according to claim 6, wherein the backlight module further comprises~~ A backlight module applied in a liquid crystal display with a first panel and a second panel, wherein the second panel is disposed opposite to the first panel and the backlight module is disposed between the first panel and the second panel, comprising:

a first light source and a second light source;

a lamp-holding member, disposed between the first light source and the second light source, wherein the lamp-holding member comprises a first side clipping part, a second side clipping part and a vertical supporting part which is positioned between the first side clipping part and the second side clipping part; the first side clipping part and the second side clipping part hold the

first light source and the second light source respectively so that the first light source and the second light source are spaced with a distance; and

a first optical device and a second optical device, ~~and wherein~~ the vertical supporting part of the lamp-holding member comprises a first cone and a symmetric second cone, the first cone is a solid body which narrows to a first point from a first round base of the first cone, the second cone ~~is~~ is a solid body which narrows to a second point from a second round base of the second cone; the first point of the first cone is in touch with the first optical device, and the second point of the second cone is in touch with the second optical device so that the first optical device and the second optical device are spaced with a second ~~equal~~ distance.

8. (Original) The liquid crystal display according to claim 7, wherein the first cone and the second cone have a reflecting surface, separately.

9. (Original) The liquid crystal display according to claim 6, wherein the material of the lamp-holding member is plastic (PC).

10. (Original) The liquid crystal display according to claim 6, wherein the material of the lamp-holding member is polymethylmethacrylic (PMMA).

11. (New) The backlight module according to claim 2, wherein the material of the lamp-holding member is plastic (PC).

12. (New) The backlight module according to claim 2, wherein the material of the lamp-holding member is polymethylmethacrylic (PMMA).

13. (New) The backlight module according to claim 7, wherein the material of the lamp-holding member is plastic (PC).

14. (New) The backlight module according to claim 7, wherein the material of the lamp-holding member is polymethylmethacrylic (PMMA).
